Business Optimization Proposal Memo

To: Linda Williams
From: Data Analyst
Subject: Proposal for Automated Marketing Performance Reporting System
Date: 07-07-2026

Problem Statement

The current marketing reporting process requires significant manual effort to clean data, update calculations, refresh Pivot Tables, and recreate performance reports. This process increases reporting time and creates the possibility of errors when handling campaign data from multiple sources. As campaign activity grows, manual reporting may delay decision-making and reduce the team's ability to respond quickly to performance changes.

Proposed Solution

Implement a standardized marketing data entry template in Excel/Google Sheets with fixed fields, required formats, and validation rules for campaign information.

The template will ensure that campaign data is captured consistently before analysis, reducing time spent cleaning datasets and improving reporting accuracy. Also future integration with Power BI is possible.

Tools Required

- Excel or Google Sheets
- Data validation rules
- Standardized campaign input form
- Shared storage folder (OneDrive/Google Drive)

Estimated Time Saving

The process could reduce weekly data cleaning and preparation time by approximately **3–5 hours**, allowing analysts to focus more on insights and recommendations.
