Personal Reflection

Over the course of this four-week project, I have developed a stronger understanding of the complete data analysis workflow, from data cleaning and preparation to business reporting and presentation. I improved my Excel skills by using formulas, PivotTables, Pivot Charts, conditional formatting, and KPI calculations to transform raw marketing data into meaningful insights. I also strengthened my ability to interpret results, answer business questions, and communicate recommendations through professional reports and presentations. One of the biggest lessons I learned is that data analysis is not only about creating charts but about telling a clear business story that supports decision-making. This project has increased my confidence in applying analytical thinking, communicating findings effectively, and using data to solve real business problems, providing a solid foundation for my continued growth as a data analyst.
